Supporting Information Fig 7. Apoptotic properties of each cell type in neurospheres derived from Twin-N-iPSCs and Twin-DS-iPSCs upon neural induction.

(A-D) Representative images of each cell type of neurospheres derived from Twin-N-iPSCs and Twin-DS-iPSCs co-stained with GFAP (in A), OLIG2 (in B), β3-TUBULIN (in C), NESTIN (in D) and cleaved caspase-3 (arrows) antibodies. GFAP⁺ cells (in A), OLIG2⁺ cells (in B), β3-TUBULIN⁺ cells (in C) were negative for cleaved caspase-3 staining. (D) Proportion of cleaved caspase-3⁺ cells among NESTIN⁺ cells in neurospheres derived from Twin-N-iPSCs and Twin-DS-iPSCs (in D). Scale bar corresponds to 10 µm. Data are represented as mean ± SEM. ** p < 0.01 by Student’s t-test from n = 4.
